Glycosylated Haemoglobin (HbA1C), EDTA Routine*

HPLC

Date	24/Aug/2021 12:34PM	Unit	Bio Ref Interval
Glycosylated Haemoglobin(Hb A1c)	4.9	%	4.27 - 6.07
Glycosylated Haemoglobin(Hb A1c) IFCC	30.04	mmol/mol	23.1-42.8
Average Glucose Value For the Last 3 Months	93.93	mg/dL	
Average Glucose Value For the Last 3 Months IFCC	5.20	mmol/L	

Interpretation The following HbA1c ranges recommended by the American Diabetes Association(ADA) may be used as an aid in the diagnosis of diabetes mellitus.

HbA1C(NGSP %)	HbA1C(IFCC mmol/mol)	Suggested Diagnosis
≥ 6.5	≥ 48	Diabetic
5.7 - 6.4	39 - 47	Pre- Diabetic
< 5.7	< 39	Non - Diabetic

HbA1C provides a useful index of average glycaemia over the preceding 6-8 weeks.

It is suggested that HbA1c is measured every 6 months in stable patients, every 3 months in patients with unstable metabolic control and every month in pregnancy.

Increased Glycated hemoglobin is a reflection of Hyperglycemia.

APTT (Partial Thromboplastin Time), Citrate Plasma*, Sodium Citrate

Date	24/Aug/2021 12:48PM	Unit	Bio Ref Interval
APTT	30.3	Sec	24.9 - 33.3
Photo-Optical-Nephelometry			
Control	28.0	sec	

Interpretation

(Activated Partial Thromboplastin Time; PTT)

APTT is the test which checks the “intrinsic coagulation” pathway and is useful for detecting screening of haemophilia A & B, screening of coagulation inhibitors like lupus anticoagulant.

APTT can also be used to monitor heparin monitoring.

Raised APTT is found in - Liver disease, DIC, heparin treatment, circulating inhibitors (Lupus Anticoagulant), and haemophilia (deficiency of Factor VIII & IX).

Low APTT may be seen in - high concentration Factor VIII and is independent risk factor for increased incidence of thrombus formation.

Advice: - ‘APTT mixing study’, ‘Lupus Anticoagulant test’, ‘specific Factor(s) assay’ may be added on for further evaluation.

Prothrombin Time (with INR), Citrate Plasma*

Date	24/Aug/2021 12:46PM	Unit	Bio Ref Interval
Prothrombin Time (PT)	14.1	Sec	12.1 - 15.1
Photo-Optical-Nephelometry			
MNPT Value	11.4	Sec	
INR	1.23		

Interpretation

(Syn: - Prothrombin Time)

PT is the test which checks the “extrinsic coagulation” pathway and is useful for detecting coagulation deficiency, liver disease and disseminated intravascular Coagulation (DIC).

PT can also be expressed as International normalized ratio (INR) used for monitoring warfarin therapy.

Raised PT value seen in - factor deficiency (Fibrinogen (I), Prothrombin (II), factor V, VII, X), oral anticoagulation therapy, liver diseases, Vitamin K deficiency and DIC.

Advice: - ‘PT mixing study’, ‘specific factor(s) assay’ may be added on for further evaluation.

Immunoassay

Test Name	Result	Unit	Bio Ref Interval
Anti Mullerian Hormone, Serum*			
Anti Mullerian Hormone (AMH) CLIA	3.34	ng/mL	0.03 - 7.15

Ref Range Interpretation :

Anti-Mullerian Hormone (AMH) is a hormone secreted by cells in developing egg sacs (follicles). The level of AMH in blood is generally a good indicator of ovarian reserve.
 Low AMH levels are considered to be an indicator of a **low ovarian reserve**, i.e. few remaining follicles. AMH levels decline with age, and in younger women this may be a sign of premature loss of fertility
 AMH does not change during menstrual cycle, so the blood sample can be taken at any time of the month - even while using oral contraception.
 AMH level for a fertile woman is 1.0–4.0 ng/ml

In males AMH is secreted by immature Sertoli cells (SC) and is responsible for the regression of Müllerian ducts in the male fetus as part of the sexual differentiation process. AMH is also involved in testicular development and function.

AMH level ng/ml	Effects for fertility treatment
<0.4	Very low value. Very few eggs at stimulation. Pregnancy chances significantly low.
0.4 – 1.0	Low value. Treatment may be possible.
1.0 – 3.5	Normal value. Good possibility of treatment.
>3.5	Suggestive of ovarian hyperstimulation syndrome / PCOS

Note :- Optimal ovarian reserve values range between 2 - 6 ng/mL in reproductive age group

TSH	uIU/ml	2.3 - 13.2	0.38 - 5.33	0.1 - 2.5	0.2 - 3.0	0.3 - 3.0

Increased in primary Hypothyroidism.
Decreased in primary Hyperthyroidism

Total Thyroid Profile : (Thyroid Function Test, TFT)
T3 (Total), Triiodothyronine
Increase in Hyperthyroidism, and T3 toxicosis,
Decreased in hypothyroidism, states with decreased TBG, and acute and subacute non thyroidal illness
T4(Total) Thyroxine
Increased in Hyperthyroidism, states with increased TBG, Thyrotoxicosis
Decreased in Hyperthyroidism, states with decreased TBG and Strenuous exercise
TSH, Serum : Thyrotropin(Thyroid Stimulating Hormone)
Increased in primary Hypothyroidism.
Decreased in primary Hyperthyroidism.

Note : TSH levels are subject to circadian variation, reaching peak levels between 2 – 4 am and at a minimum between 6 – 10 pm. The variation is of the order of 50% - 206 %, hence time of the day has influence on the measured serum TSH concentrations.
TSH assay is strandized to the 3rd generation for human TSH.
The Cyclical variations may be quite large; therefore the timing of specimen collection must be strictly controlled.
Advise : Kindly do Thyroid Profile/TSH in morning hours only.

Serology Viral Markers (Rapid)

Test Name	Result	Unit	Bio Ref Interval
-----------	--------	------	------------------

Rapid Card Test - HCV*, Serum

Immunochromatography

HCV Card Test	Negative
---------------	----------

Comment Interpretation

It is only a screening test. All reactive samples should be confirmed by HCV quantitative PCR.
A non reactive result does not exclude the possibility of exposure to or infection with HCV.
Patients with auto immune liver disease may show falsely reactive results

Rapid Card Test - HIV I & II*, Serum

Immunochromatography

Rapid Card HIV I & II	Negative
-----------------------	----------

Comment This is only a screening test. All samples detected reactive must be confirmed by using HIV RNA PCR / three different methods.
A non- reactive test result does not exclude the possibility of exposure to an infection with HIV (Window Period) or low viral load.

Advice:

1. HIV by 3 different methods
2. Confirmatory HIV RNA Quantitative PCR.

RPR(Syphilis) Slide Flocculation	Non Reactive
-------------------------------------	--------------

Comment

Interpretation

1. It is a screening test for syphilis which is useful for following the progression of disease and response to therapy. Rising titers are of immense value in confirming the diagnosis.
2. Biological false positive reactions exhibit low titers and are seen in conditions like Viral fevers, Mycoplasma infection, Chlamydia infection, Malaria, Immunizations, Pregnancy, Autoimmune disorders & past history of Treponemal infection.
3. It is advisable to confirm the diagnosis by tests such as TPHA & FTA-ABS.
4. A definitive clinical diagnosis should not be made by result of a single test only, but should be made by taking clinical history and other laboratory findings in to account.

Rapid Card Test - Hepatitis B Surface Antigen*, Serum

Immunochromatography

Rapid Card HBsAg	Negative
------------------	----------

Comment

Interpretation

This is only a screening test.

All reactive samples should be confirmed by 'HBsAg confirmatory test or HBV DNA PCR'.

A non – reactive does not exclude the possibility of exposure to infection with HBV (window period)

False positive results can be obtained due to the presence of other antigens or elevated levels of RF factor.

Advise: Confirmatory test 'HBsAg Confirmatory Quantitative' test followed by 'HBV DNA quantitative PCR'

Kindly correlate with clinical findings

Hb HPLC is used for screening of Beta Thalassemia and detection of many other haemoglobin variants (Hemoglobin E, D Punjab, Sick cell anaemia etc.) along with their concentration to establish zygosity.

Normal HbA2 values can be seen in Alpha Thalassemia trait, silent/ atypical Beta Thalassemia and Beta Thalassemia with iron deficiency.

A repeat Hb HPLC should be performed after replenishing iron stores in cases with microcytic hypochromic indices.

Advise: -

If there is absence of iron deficiency & persistence of microcytic hypochromic indices, then the possibility of Alpha Thalassemia trait or silent/ atypical Beta Thalassemia trait cannot be ruled out. Hb HPLC of parents and molecular sequencing of globin genes are recommended in these cases.

In individuals with beta thalassemia trait and carriers of haemoglobin variants –

1. Familial study is recommended.
2. In cases of young/ pregnant females - Hb HPLC testing of spouse is strongly recommended.
3. Genetic counselling

Microbiology

Urine Culture & Sensitivity

Method : Semi quantitative-Culture/ID & Sensitivity by Vitek 2

Result : No growth.
 Interpretation: Sterile after Overnight/24 hours of aerobic incubation at 37 degree C.

Comment

Urine pus cells /HPF	Colony count	Interpretation
<5	10 ³	Insignificant growth, more likely to be a colonizer. To be treated only if the patient is symptomatic
<5	10 ⁴	Moderately significant growth. Should be correlated clinically and to be treated only if the patient is symptomatic
<5	10 ⁵	Significant growth. Should be treated if the patient is clinically symptomatic
>5	10 ³ / 10 ⁴ / 10 ⁵	Significant growth. Should be treated if the patient is clinically symptomatic
5 - 10	No growth	Kindly rule out the cause of sterile pyuria i.e Is the patient on antibiotics Or anyother systemic illness (e.g TB /STD)
>5	Mixed growth	Mixed growth of more than two types of organisms indicating specimen colonization. Kindly send mid-stream urine sample after proper collection.

Kindly correlate with clinical findings
