Increased in primary Hypothyroidism.
Decreased in primary Hyperthyroidism

Note : TSH levels are subject to circadian variation, reaching peak levels between 2 – 4 am and at a minimum between 6 – 10 pm. The variation is of the order of 50% - 206 %, hence time of the day has influence on the measured serum TSH concentrations.

Serology Viral Markers (Rapid)

Test Name	Result	Unit	Bio Ref Interval
-----------	--------	------	------------------

Rapid Card Test - HCV*, Serum

Immunochromatography

HCV Card Test Negative

Comment Interpretation

It is only a screening test. All reactive samples should be confirmed by HCV quantitative PCR
A non reactive result does not exclude the possibility of exposure to or infection with HCV.
Patients with auto immune liver disease may show falsely reactive results

Rapid Card Test - HIV I & II*, Serum

Immunochromatography

Rapid Card HIV I & II Negative

Comment This is only a screening test. All samples detected reactive must be confirmed by using HIV RNA PCR / three different methods.
A non- reactive test result does not exclude the possibility of exposure to an infection with HIV (Window Period) or low viral load.

Advice:

1. HIV by 3 different methods
2. Confirmatory HIV RNA Quantitative PCR.

Comment

Interpretation

1. It is a screening test for syphilis which is useful for following the progression of disease and response to therapy. Rising titers are of immense value in confirming the diagnosis.
2. Biological false positive reactions exhibit low titers and are seen in conditions like Viral fevers, Mycoplasma infection, Chlamydia infection, Malaria, Immunizations, Pregnancy, Autoimmune disorders & past history of Treponemal infection.
3. It is advisable to confirm the diagnosis by tests such as TPHA & FTA-ABS.
4. A definitive clinical diagnosis should not be made by result of a single test only, but should be made by taking clinical history and other laboratory findings in to account.

Comment**Interpretation**

This is only a screening test.

All reactive samples should be confirmed by 'HBsAg confirmatory test or HBV DNA PCR'.

A non – reactive does not exclude the possibility of exposure to infection with HBV (window period)

False positive results can be obtained due to the presence of other antigens or elevated levels of RF factor.

Advise: Confirmatory test 'HBsAg Confirmatory Quantitative' test followed by 'HBV DNA quantitative PCR'

Kindly correlate with clinical findings
