 Ph: 0120-4234948

PATIENT NAME	Ms. AKANSHA SAXENA			PATIENT ID	10057737
LAB NO	11010390	AGE	31 Y	GENDER	Female
DRAWN	24/08/2021 14:09	RECEIVED	24/08/2021 15:22	DATE OF BIRTH	24/08/1990
REF. BY	Self			REPORTED	24/08/2021 20:32
				Report Status	Final
PATIENT HISTORY					
SRF No	0914400354991	Adhaar Card	2447 5714 9345	Passport No	
Investigations	Result		Reference Range		Unit

MOLECULAR BIOLOGY

SARS-CoV-2 RT PCR,NP/OP SWAB

SARS COV -2 RNA NOT DETECTED NOT DETECTED
 Method: RT PCR

Interpretation:

"Detected" test results indicate RNA from SARS COV-2 was detected and the patient is presumed to airborne infection of COVID-19 and could be contagious. "Not Detected" test results means, RNA from SARS COV-2 were not found in the specimen or not present in detectable limites, to have been picked up. The threshold cutoff cycle **CT is 38**.

SARS COV-2 also known as 2019 nCoV is the causative agent of the corona virus disease 2019(COVID-19).

ICMR approved kits are being used for reporting.

SARS COV-2 detection is being done by qualitative test method, based on Real time PCR technology. It does not quantify viral load.

This assay uses a positive and negative control, RNaseP to indicate specimen acceptable quality gene and RdRp/N gene to detect SARS COV-2 infection.

Test performed on Bio-Rad CFX-96.

NABL Registration number MC-4403.

ICMR Registration number for COVID-19 is MEDPLNUP

All positive cases are notified to ICMR for future surveillance.

Comment:

RT-PCR can only interpret the viral load if it is detectable.

Negative results do not rule out possibility of COVID-19 infection and should be in correlated with clinical observation, patient history and epidemiological information.

Detected results will not rule out co-infection with other viruses.

Optimum sample type and the stage of infection in which sample was procured, Plays an important role in reporting of COVID 19 infection.

Ct values are inversely proportional to the significant viral load (higher the Ct value lower will be the viral Load).

Asymptomatic/ Presymptomatic cases may show high Ct value with or without showcasing symptoms.

Ct Values are not absolute indication of viral load and are affected by variation of specimen collected.

In advent of delayed onset of symptoms or persisting ILI symptoms, kindly repeat test after an interval.

** The Lab is NABL accredited & ICMR approved.
