

REPORT

Patient Name : Mrs. ANURADHA GOYAL	Registration No : 82929
Age/Sex : 42 Y/Female	Registered : 20/May/2022
Patient ID : 012205200036	Collection : 20/May/2022 01:01PM
Barcode : 10085801	Received : 20/May/2022 01:49PM
Ref. By : Self	Reported : 20/May/2022 06:22PM
SRF No. : 0914400619133	Panel : ARCTERN HEALTHCARE PRIVATE LIMITED
Aadhar No : 312577911158	Passport No. :

Test Name	Value	Unit	Bio Ref.Interval
-----------	-------	------	------------------

SARS COVID-19 RT PCR

SARS COV-2 Detection **NEGATIVE**

Reverse Transcriptase Polymerase Chain
Reaction (RT PCR)

NOTE:ICMR Registration number for COVID-19 is TDHSLNUP

Interpretation:-

'POSITIVE' test results indicates RNA from SARS COV-2 was detected and the patient is presumed to harbor infection of COVID-19 and could be contagious.

'NEGATIVE' test results means, RNA from SARS COV-2 were not found in the specimen or not present in detectable limits, to have been picked up.

The threshold cutoff cycle Ct is 35.

Note:- SARS COV-2 also known as 2019 nCoV is the causative agent of the corona virus disease 2019 (COVID -19).

ICMR approved kit/s is/are being used for reporting.

SARS COV-2 detection is being done by qualitative test method, based on Real Time PCR technology. It does not quantify viral load.

This assay uses a positive and negative control; RNaseP to indicate specimen acceptable quality; E gene and RdRp /N gene to detect SARS COV-2 infection.

Test performed on Bio-Red CFX96 Real Time PCR.

All positive cases are notified to ICMR for future surveillance .

Comment:- RT-PCR can only interpret the viral load if it is detectable. It plays no role in predicting an individual's capability to spread infection or be infectious, Negative results do not rule out possibility of COVID – 19 infection and should be in correlated with clinical observation, patient history and epidemiological information. Positive results will not rule out co-infection with other viruses. Optimum sample type and the stage of infection in which sample was procured, plays an important role in reporting of COVID 19 infection. Ct values are inversely proportional to the significant viral load(higher the Ct value, lower will be the viral load) Asymptomatic / Presymptomatic cases may show high Ct value with or without showcasing symptoms Ct values are not absolute indication of viral load and are affected by variation of specimen collected. In advent of delayed onset of symptoms or persisting ILI symptoms, kindly repeat test after an interval.

For Positive Patient Advice: Covid – 19 Severity panels (CBC, CRP,LDH,D-Dimer,Interleukin IL6,Ferritin).

For Negative Patient Advice : Immunity Panel (IgE, IgA, IgG, IgM, CBC, Vit B-12, Vit – D, KFT,LFT, Covid Ab IgG).
