Anti Mullerian Hormone, Serum*

Anti Mullerian Hormone (AMH)	0.89	ng/mL	0.07- 7.35
------------------------------	------	-------	------------

CLIA

Ref Range Interpretation :

Anti-Mullerian Hormone (AMH) is a hormone secreted by cells in developing egg sacs (follicles). The level of AMH in blood is generally a good indicator of ovarian reserve.

Low AMH levels are considered to be an indicator of a **low ovarian reserve**, i.e. few remaining follicles. AMH levels decline with age, and in younger women this may be a sign of premature loss of fertility

AMH does not change during menstrual cycle, so the blood sample can be taken at any time of the month - even while using oral contraception.

AMH level for a fertile woman is 1.0–4.0 ng/ml

In males AMH is secreted by immature Sertoli cells (SC) and is responsible for the regression of Müllerian ducts in the male fetus as part of the sexual differentiation process. AMH is also involved in testicular development and function.

AMH level ng/ml	Effects for fertility treatment
<0.4	Very low value. Very few eggs at stimulation. Pregnancy chances significantly low.
0.4 – 1.0	Low value. Treatment may be possible.
1.0 – 3.5	Normal value. Good possibility of treatment.
>3.5	Suggestive of ovarian hyperstimulation syndrome / PCOS

Note :- Optimal ovarian reserve values range between 2 - 6 ng/mL in reproductive age group

Kindly correlate with clinical findings
