

Name: Neha

Age: 32 years

Gender: Female

Marital Status: Married

Education: Graduation

Date of Session: 04/09/2022

Referral Purpose: The client was referred by India IVF Clinic, Gurgaon to evaluate her level of anxiety

Background and preliminary impression

Session was held with the client. She has been married for 9 years. The client and her husband were trying to conceive soon after marriage. However, due to a cyst and subsequent inability, they opted for IVF. With the outcome of the procedure being favorable, the client has a 3.5 year old daughter through IVF. However, during the 8th month of her pregnancy, the client reported that she would often feel anxious about her ability to cope with the changes brought forth with a child. She would often think about how she would manage, what if she had to cope with challenges alone and the like. If the baby cried, she would also think of the worst case scenario and this further made her anxious. When her daughter was 2 years old (during COVID), she would worry about her ability to manage situations alone if something happened to her husband. Gradually, the frequency of these thoughts have reduced over time. The client often sought reassurance from her husband regarding everything being alright. Soon, the client planned for a second child through IVF. However, in August 2022, the ET failed.

The client and her husband share a close bond with each other. She also has a very supportive family with her in-laws visiting her frequently. There is no history suggestive of any past medical or psychiatric history. Appetite and sleep were reported to be normal.

Test Findings from the First Session

On PSS, the client has a score of 8, indicating **low stress**. On Beck's Anxiety Inventory, findings suggest **low anxiety** and on HAM-A, the client has a score of 3, indicative of **mild severity of symptoms of anxiety**. Score on PHQ-9 also suggests minimal depression.

Hence, history, clinical observations and test findings are suggestive of low stress and anxiety.

Anxious thoughts pertaining to inability to cope and overestimation of likelihood of danger are present. Thus, further sessions are recommended to address the same.

Psychological Intervention Plan

Three sessions are planned to work on enhancing the client's skills to deal and cope with stress.

Suggestions

- Relaxation training and coping skills
- Cognitive restructuring to change unhelpful thinking patterns

Home Work:

- Practicing diaphragmatic breathing as taught in session, 4-5 times each day
- Maintain a thought journal

Recommendations from the App\Website:

Meditation- Breathing Techniques
